

ABSTRACT

A fastening device for a radiator is used o fasten the radiator to the heat generating unit so as to cool the heat generating unit. The fastening device for a radiator has a locating part, which has secure arms being processed with heat treatment, for supporting and locating the radiator. Because the secure arms are provided with a property of elasticity in addition to the rigidity itself, a feature of pressure adjustment can be obtained from the secure arms while the fastener engages the radiator to the base plate.
